

Byazit Bostami

AI/ML Infrastructure & DevOps Engineer (M.Sc.)

byazit@gmail.com | +46 (0)720 15 99 21 | linkedin.com/in/byazit-bostami-8351a925 | Stockholm, Sweden

PROFILE SUMMARY

Computer engineer (M.Sc.) with a DevOps and infrastructure automation background spanning telecom, fintech, and SaaS environments, now focused on AI/ML infrastructure. Experienced in containerized deployment (Docker, Kubernetes/OpenShift), CI/CD pipelines, and hands-on local LLM deployment with Ollama — configuring hardware and runtime environments to serve models on-premise and at the edge. Comfortable owning infrastructure end-to-end, from bare-metal and embedded hardware through to production pipelines.

CORE SKILLS

AI/ML Infrastructure: Ollama (local LLM deployment & serving), model/hardware sizing (CPU/GPU/RAM), containerized inference environments

Containers & Orchestration: Docker, Kubernetes, OpenShift, Podman

CI/CD & Automation: Jenkins, Git, SonarQube, Bash scripting, cron-based automation

Cloud & Infra: AWS, GCP, Linode, Cloudflare, self-managed bare-metal (Intel NUC home server)

Observability: Grafana

Languages & Frameworks: PHP, JavaScript/Node.js, Java, PostgreSQL, MySQL, CodeIgniter, Laravel

Embedded / Edge: Raspberry Pi, ESP32, ESP8266, ATtiny85, Arduino, MQTT, LoRa

RELEVANT WORK EXPERIENCE

DevOps Engineer (Freelance) — Upwork, Stockholm

May 2025 – Present

- Deliver contract DevOps engagements covering CI/CD pipeline design, infrastructure automation, and containerized deployments for international clients.
- Set up and configured local LLM environments using Ollama, including hardware selection and runtime tuning to run models on-premise without cloud dependency. [add: number of clients/projects, or a specific model/use case delivered]

Backend & Infrastructure Developer — Senico Consulting AB, Stockholm

December 2023 – April 2025

- Migrated legacy PHP applications to Node.js, modernizing backend services and deployment workflows.
- Built backend services on Node.js and PostgreSQL, deployed via Docker.
- Delivered JSON API integrations for cross-service data exchange. [add: how many services/systems integrated, or latency/reliability improvement if known]

DevOps Engineer — CVITCH AB, Stockholm (client-site assignment: Ericsson)

April 2022 – November 2023

- Placed on-site with Ericsson (Sept 2022 – Apr 2023) as part of a 25-developer global team (Sweden, Canada, South Korea) on Ericsson's proprietary EWS 5G network system.
- Updated and implemented Java code for 5G network development and enhancements.
- Owned CI/CD and platform tooling for the team: Jenkins for automated deployments, SonarQube for code quality gating, Kubernetes for container orchestration, Git for version control, and Grafana for monitoring/visualization.
- Administered Red Hat Linux and OpenShift environments for container orchestration outside the Ericsson engagement.

Founder / Self-Employed Developer — Stockholm

August 2020 – April 2022

- Designed, built, and deployed multiple independent products end-to-end (backend, mobile app, and infrastructure), including a photo-printing service for the Bangladeshi diaspora, a two-sided restaurant ordering system, a vendor marketplace app, and a real-time collaborative list-sharing app.
- Self-hosted all projects on a personally managed Intel NUC server using Docker for containerized deployment — full ownership of infrastructure, from hardware to release.

Integration Engineer / Full-Stack Developer — Scrive, Stockholm

January 2020 – July 2020

- Transitioned from PHP to Node.js within two months; built API integrations using Docker containers.
- Contributed to Agile team-driven development cycles.

IT Infrastructure Developer — Nordfin Capital, Stockholm*November 2017 – December 2019*

- Independently designed and built Nordfin's entire IT infrastructure from the ground up — sole ownership of hardware procurement, configuration, and a multi-purpose server stack (Web, ETP, SQL, VPN).
- Automated server maintenance and backups via Bash + crontab.
- Managed the company website (CodeIgniter, PHP, JavaScript) with no established protocols or prior documentation to work from.

Full-Stack Developer — DinBox, Stockholm*September 2015 – March 2016*

- Rebuilt the laundry booking system's update flow in Node.js, cutting processing time down from roughly one hour. [add: the actual resulting time — e.g. "to under 5 minutes"]

R&D Engineer (Project) — ABB, Västerås*November 2014 – April 2015*

- Built a hands-free home automation and indoor navigation system: BLE/Arduino/Raspberry Pi hardware with a JavaScript/Android front end, using UWB and high-accuracy RTLS for real-time indoor positioning.

EDUCATION

M.Sc., Computational Science and Engineering — Umeå University, Sweden

B.Sc., Computer Science and Engineering — East West University, Dhaka, Bangladesh
